

drylin® R Round Shaft Guide Systems

Lubrication-free

Corrosion-resistant

Wear-resistant

Insensitive to dirt

Low friction

Extremely quiet operation

Low weight

drylin® R linear plain bearings are based on extremely wear-resistant polymers specially developed for the linear technology. The dimensions are compatible with standard ball bearings. The special geometry guarantees ruggedness even in extreme environments.

Liner
open or closed

Solid polymer bearing

Linear bearing
open or closed

Housing bearing

Advantages:

- 100 % lubrication-free
- Dimensionally interchangeable with standard recirculating ball bearings
- Large variety of choice in housing shapes
- Shafts, shaft end supports and accessories available from stock
- 8 different shaft materials
- Replaceable liner
- VA stainless steel housing available

Lubrication-free

- Liners made of high-performance iglidur® J guarantee optimum running properties and long service life
- Bearing in iglidur® X for extreme environmental conditions (chemicals/temperature)

Robust and corrosion-resistant

- ① Hard-anodized aluminum shafts (round shaft-supported round shaft), steel and stainless steel shafts
 - ▶ shafts, page 927
- ② Linear adapter and complete housing in anodized aluminum
- ③ Liners made of high-performance iglidur® J/J200/X

Many versions available from stock

- Liners made of iglidur® high-performance polymers, standard and precise bearing clearance, linear adapter, complete housing in various shapes, solid plastic bearing
- House Bearing and Floating House Bearing

When not to use them?

- When little installation space is available

drylin® R | Technical Data

drylin® R

Linear Plain Bearings

The drylin® standard round bearings consist of a replaceable iglidur® J, J200 or X liner, that is manufactured to be a mechanical fit into an anodized aluminum adapter. The axial securing of the liner is achieved by a snap ring groove. drylin® R linear plain bearings, made from solid polymer, are dimensionally equivalent to standard ball bearings. They are made entirely out of wear resistant iglidur® J, J200 or X material and can offer technical advantages in addition to the clear price advantage. Thus, applications in which machine parts are primarily stainless steel, i.e. food and filling equipment, are well suited for the use of solid plastic bearings. An additional weight-saving is also easily obtained. Both designs are designed for fitting in housings with our recommended tolerances. The bearings are secured by circlips in the same way as with ball bearings. The narrow design of the 02 design series, is pressfit or bonded into the housing. Standard commercial adhesives can be used for this purpose.

Dirt, Dust, Fibres

An important feature of all the linear plain bearings is their tolerance of dirt and abrasive particles. For most conventional bearing systems, the use of wiper or seals is recommended to prevent dirt accumulation. No other system has the design

benefits for use in dust, lint, and coarse dirt as drylin®. The patented design of the bearing surface using individual slide pads connected by thin film sections, provides performance benefits for dirty environments. Dirt, even if it becomes wet on the shaft, is wiped away by the individual glide pads and is moved into the open areas. The running sections of the drylin® bearings then slide on the shaft that has been cleared of all contaminants.

Split Linear Bearings

Applications that are on the edge of technical feasibility or in extremely harsh environments often require frequent replacement of the linear bearings. In many cases, drylin® can give a multiple increase in the service life. However, in extreme applications, replacement of the bearings is necessary, even with drylin®. drylin® linear bearings can provide considerable cost reductions in such cases as only the polymer bearing liner has to be replaced. This often means a reduction of more than 90 % in replacement part costs. The iglidur® J liner can be easily replaced, while a ball-bearing cage cannot. The range of split adapters offers even greater cost savings. Shafts no longer need to be removed from the housing. The two shells of the adapter can be opened very easily. The high performance polymer bearing inside is split and can easily be pulled off the shaft. Clip a new bearing liner over the shaft, put the two adapter halves together, install – done! With this product line of split drylin® bearings, installation times can be reduced to a minimum.

drylin® R | Technical Data

Series L1 – Low-clearance press-fit bearings

The series L1 plain bearings are composed of the iglidur® L100 bearing material, an extremely wear-resistant plastic compound. They are sub-divided into a press-fit area and a gliding range. They can be used both as individual part and as press-fit bearing in linear plain bearings of the drylin® R series. The gliding range is composed of individual crossbars which are linked to each other by thin film bridges. These film bridges on the one hand prevent the divergence of the individual crossbars, but on the other compensate all expansions of the bearing through heating or moisture. This separation enables the almost clearance-free design of the bearings, as there is no clamping of the shaft. The cylinder-shaped press-fit area is also visually very distinct from the gliding range. The singular function of this range, which shows a distinct clearance compared to the shaft, is to fix the bushing firmly in the housing.

- High wear resistance
- Low coefficient of friction
- Vibration dampening
- High static compressive strength
- Good chemical resistance
- Resistant to dirt
- Suitable for soft and rough shafts

Compressive strength

iglidur® plain bearings are homogeneously filled with solid lubricants. In this way, lubricants cannot be removed, even at high loads. The material iglidur® L100 allows an average static surface pressure pf 70 MPa. However, only half of the bearing surface can carry loads and this is taken into account in the calculation.

Surface Speeds

The following table shows possible surface speeds of L1 bearings.

iglidur® L100	Rotating	Oscillating	Linear
Continuous (m/s)	1.5	1.5	3
Short term (m/s)	3	3	10

Table 04: Maximum running speed for iglidur® L100

Coefficients of sliding friction

Plain bearings of the L1 series are designed for dry operation against steel. The best results are attained with surface finishes of 0.8 µm. The coefficients of sliding friction reduce with increasing load. Typical values in dry operation are 0.2 to 0.3. But the value can be higher with unfavorable shafts.

Temperatures

Temperatures affect the compressive strength, the wear and the securing of the bearing in the housing. In all tests, a secure pressfit could be held up to a temperature of 70 °C. At higher temperatures, an additional securing of the bearing is recommended. With effective securing, L1 plain bearings could also be used at temperatures over 100 °C.

iglidur® L100	Application temperatures
Minimum	-30 °C
Max. long term	+100 °C
Max. short term	+190 °C

Table 05: Temperature limits for iglidur® L100

Self-Aligned Bearings

drylin® R linear plain bearings in the 03 design series offer great advantages in applications with parallel shafts. By their geometry, they are able to compensate for alignment and parallelism errors and should be used on the shaft located furthest from the drive mechanism.

The design provides a spherical area on the outside diameter of the aluminum adapter for self-alignment. Reductions in load capacity are prevented, since the shaft always lies on the total projected surface.

Due to the even load distribution over the entire bearing, edge loads are not possible with the self-aligning drylin® linear bearings. Even in unfavourable conditions, the load is supported by the entire projected surface.

In order to compensate for parallelism errors between two shafts, the outer diameter is designed to be smaller than the housing bore diameter by 0.2–0.3 mm (depending on the size). With the use of mounted O-rings, these bearings have an elastic bearing seat.

The clearance between the bearing and housing allows for the maximum compensation of possible shaft mis-alignment. The drylin® R self-aligning bearings are supplied hard anodized. These surfaces guarantee the highest wear resistance if the aluminum bearing moves in the housing during compensation adjustments.

Graph 04: By defined installation clearance and externally mounted O-rings, the self-aligning drylin® R bearings of the type series 03 can compensate parallelism errors. Spherical drylin® adapters can compensate angle errors. Hard anodization protects the aluminum adapters against wear.

Eccentric Forces

To ensure successful use of maintenance-free drylin® linear bearings, it is necessary to follow certain recommendations: If the distance between the driving force point and the fixed bearings is more than twice the bearing spacing (2:1 rule), a static friction value of 0.25 can theoretically result in jamming on the guides. This principle applies regardless of the value of the load or drive force.

The friction product is always related to the fixed bearings. The greater the distance between the drive and guide bearings, the higher the degree of wear and required drive force.

Failure to observe the 2:1 rule during a use of linear slide bearings can result in uneven motion or even system blockage. Such situations can often be remedied with relatively simple modifications.

If you have any questions on design and/or assembly, please contact our application engineers.

drylin® R | Installation instructions

drylin® R shaft guides are designed for completely lubrication-free operation. The dimensions of the respective linear adapter and housing meet the standard for recirculating ball bearings. During assembly, please note the following installation instructions:

Construction tips for drylin® linear plain bearings:

The above values for „F_{max}“ relate to the performance of the iglidur® liners made of high-performance plastics and cannot be used as the sole criterion for the calculation of an application. The maximum carrying capacity of the entire bearing system depends on the installation position, housing shape, the housing material, the connection including the screws used and requires a separate inspection. For a detailed dimensioning, please use our online configurator at ► www.igus.eu/drylin-expert

Open anodized aluminum adapter – version 01

Open anodized aluminum adapter – version 03 (floating)

- For supported shafts
- With reduced outer diameter, spherical area on the outer diameter, O-rings for elastic seating and hard anodized surface

* according to igus® testing method ► page 925

Please note:

igus® Testing method for measuring the tolerance of drylin® plain bearings

To ensure the correct function of a drylin plain bearing, it is necessary to use the bearing with a defined minimum clearance. The quality control of this dimension is carried

out with a plug gauge test. For this purpose, specific force is defined with which the plug gauge is loaded when the plain bearing is tested.

Part number	Test force [N]	Ø-i test housing	Min. bearing Øi (c. gauge-free)	Max. bearing Øi (with c. gauge)
JUM-01/02-10	0.981	12.000 mm	10.030 mm	10.070 mm

Explanation:

The iglidur® X material has a higher stiffening than iglidur® J. This causes shifts – depending on the diameter – compared to the ratio of test force to LD diameter. The parts are designed in such a way that under load the clearance between the iglidur® X and iglidur® J bearings is as identical as possible. Thereby in the use of iglidur® X liners, increased shifting forces can occur in the unloaded new condition on an h-toleranced shaft.

When using a plain bearing (JUM/RJM) in connection with a housing (RJUM, OJUM, RGA) the factory tolerance of the housing bore (standard case: H7) is also added to the minimum clearance stated above. The total from these two values then produces the maximum possible bearing tolerance. Plain bearings of the dimensional series "Japan-Std." (JUJ) are tested according to the same criteria for the JUM plain bearing.

The effective clearance is also influenced by shaft tolerance. The undersize of shaft may be added.

F_{max} dynamic:

The maximum values are the result of the projected surface and 5 MPa surface pressure.

F_{max} static:

The maximum values are the result of the projected surface and 35 MPa surface pressure.
